

Malawi

Hi again! We're on a photosynthesis safari in Africa with the DOE Office of Science visiting our projects across the globe and universe! Farmers in Malawi are using the MultispeQ tool developed at MSU's Plant Research Lab to make decisions about the best agricultural practices for their land and increase their yields. This hand-held tool collects a huge amount of plant data and uploads it to a platform where the user can analyze it. It's great to see how people are using our science in the real world!

Wish you were here!
